

## Welcome To The Course :)

Hi Everyone,

Lot of you have joined the course recently and we are as excited as you to have you in the course!

But since it is a new offering, and made recently in Lockdown Period only, we are still working on some sections of the course which will be added in couple of days. Also we come with new versions of the course periodically and keep on revising content.

There are few things you should know before starting with the course. This is an **applied DS course** - where you will learn to apply Data Structures in Real Life projects as the course title says. We assume you are already familiar with basics of HTML/CSS and programming in any one language like Python, C++ or Java. So we will start with **some boiler plate code (pre-written code)** in some of these projects and discuss/implement the data structures & algorithms specific code.

We will use **JavaScript** mostly for the course, the basics of which are covered in the first section.

To improve the course, and work on new ideas **your suggestions/ideas** are welcome, if you have difficulty understanding in some section or feel more explanations are required drop us a feedback email at [prateek@codingblocks.com](mailto:prateek@codingblocks.com).

I and Aarnav will try our best to work on those topics and also add new projects whatever we can.

Hoping you learn something new from the course :)

Regards

Prateek & Aarnav
